Bowden Installation Instructions

Bowden Controllers/ Wire & Casing / B-Kits

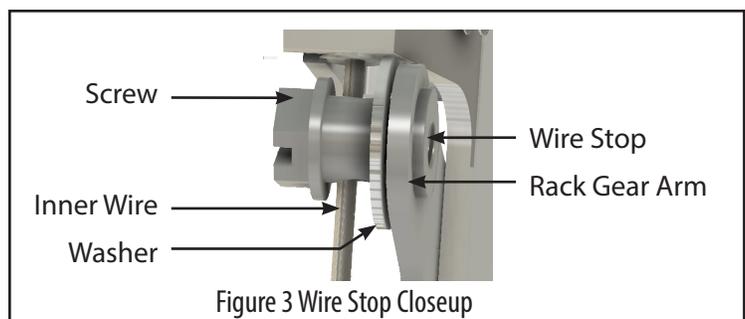

Step 1 Run Wire

- Run the casing from the location where the controller will be to the damper.
 - It should be as straight as practical and **Should be secured to the building structure at least every 5 feet.**
 - Any turns should have at least a 3 foot radius in order to ease the inner wire through the turn.
 - Limit cable length to no more than 50 feet. For a longer reach use Young Regulator Electronic Balancing Dampers.
- Casing can be cut to length with a pair of wire cutters.
- Feed the inner wire through the casing. It should slide easily.
- Leave at least 3" of inner wire on each end.

Step 2 Assemble the 270 Controller

- Rotate the control shaft counter-clockwise until the rack is in the full-up position. **Then return clockwise two clicks.**
- Secure the outer casing in the casing clamp.
- Install stainless inner-wire into the hole in the wire stop. The washer must be between the controller rack gear and the hole. (See Figure 3)
- Tighten the screw until the wire starts to bend.
- Install controller to termination bracket or ceiling cup using the mounting bracket nut.
- Install the mounting bracket with the controller to a ceiling joist, plenum, diffuser or access panel.

Step 3 Connect the Damper

Steps 1 - 5 for B-Kits
Dampers by Others

- Slide angle bracket over the shaft.
- Align the angle bracket perpendicular to the damper shell and fasten securely to the damper shell.
- Slide the hub onto the shaft.
- Rotate the shaft until the damper is fully closed.
- Orient the hub so that it is 45° above the horizontal. (a little past 10:00 on a clock face) fasten the two set screws securely with a 1/8" allen wrench.
- Install the casing coupling to the middle hole in the bottom of the angle bracket. Secure with the keps nut.
- Slide the inner wire through the casing coupling then through the wire stop in the hub. Push the casing into the coupling until it bottoms out (approx. 0.5"). Tighten the thumb screw securely.
- Thread the inner wire through the wire stop attached to the hub. (This is the same as on the controller without a washer.)
- Confirm the Hub is positioned as shown in figure 4.
- Tighten the wire stop on the hub.
- Confirm proper operation of the damper by exercising the control from full opn to full closed.

Installation Validation

- Rotate the controller clockwise with the 030-12 wrench. It should move freely. If it is **Hard to turn?** - Check the path of the casing. Ease any turns, ensure it is not moving as the inner wire tries to move up and down.
- When the controller is rotated full clockwise the damper should be full open. If it is **Not Fully Open?** - Adjust starting position of the hub. Release the inner wire and adjust the hub position on the shaft.
- Cut off any excess inner wire.

Ceiling Terminations	Description	Application
270-275	Rack and Pinion Controller w/angle bracket	Inside plenums, atop square diffusers, behind grille, above a drop ceiling or access panel
270-275 PH	As above, adjusted with phillips head screwdriver	Inside plenums or above drop ceilings
270-275ML	Angle bracket with extended control shaft	Inside plenums with Ice Tong style diffusers
270-301	Ceiling cup and 3" cover	Embedded in a Sheetrock ceiling
270-301BC	As above, with bracket to fasten cup to stud	Embedded in a Sheetrock ceiling
270-301EZ	Angle bracket and 3" cover plate	Above any ceiling
270-315	Cup and 2.25" threaded cap	Higher security cover
270-315BC	Cup, 2.25" threaded cap & 3" cover plate	Embedded in a Sheetrock ceiling
270-896	"C" bracket, screw cap 1" head	Embedded in a Sheetrock ceiling
4-Port	Four Position Balancing Station	Bring all of the cables for an area to one place
Ceiling Terminations	Description	Application
270-302	Cup and Cover plate - wall mount	Embedded in a plastered wall
270-700	4x4 box with Stainless Cover and attractive adjustment knob	Wall mount "Manual Thermostat"
270-896L0	"C" bracket, screw cap 1" head - Wall mount	Embedded in a plastered wall
B-Kits	Shaft Size	Application
270-XXXB	1/2" round or 3/8" square shafts	Dampers by Others
270-XXXQ	5/16" round or 1/4" square shafts	Dampers by Others

830-ACC set up

Bowden Cable Controls

The 830-ACC damper features a direct connection between the damper slide and the inner wire of the Bowden Cable system.

Cable comes either in bulk or cut to your specified length. See page 1 if you need to adjust wire length.

1. Attach Cable to Damper

Slide the inner Wire through the casing coupler and insert in the wire stop (which is attached to the damper slide).

2. Run the Cable

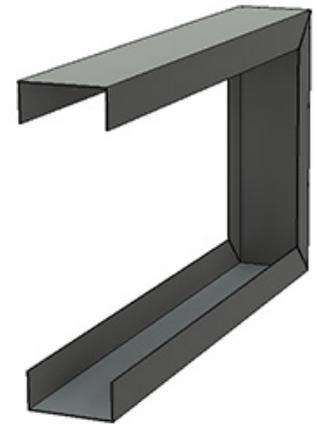

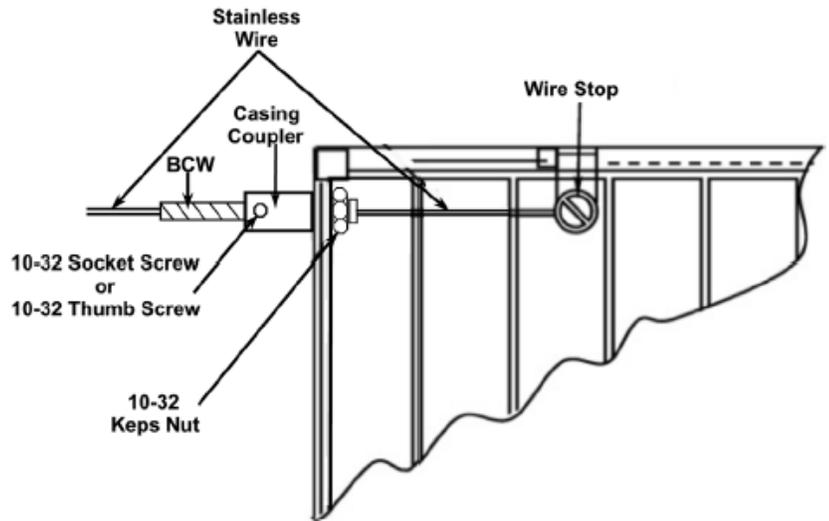

Route the Cable to the location where the Controller will be. See "Run the Wire on Page 1 for more details.

3. Connect the Controller

See Assemble the Controller on Page 1.

4. Install the Damper

The damper can be installed into the end of the duct simply by screwing the frame of the damper to the walls of the duct. If you are in the middle of a piece of duct, you can use a "filter frame" to hold the damper in place. Cut a slot in the duct wide enough to accept your channel. Slide the damper into the frame and use a piece of scrap steel and/or UL 181 tape to seal the slot.

Filter Frame
